## **Multiple Sclerosis Symptoms, Causes, Diagnosis and Treatment**

Multiple sclerosis (MS) is an immune-mediated inflammatory disease that attacks myelinated axons in the central nervous system, destroying the myelin and the axon in variable degrees and producing significant physical disability within 20-25 years in more than 30% of patients. The hallmark of MS is symptomatic episodes that occur months or ye

## **Bing: 2017 Multiple Sclerosis Scientific Research**

Multiple sclerosis (MS) is a chronic inflammatory demyelinating disease that affects the central nervous system (CNS). Several therapies for it exist, although there is no known cure. The most common initial course of the disease is the relapsing-remitting subtype, which is characterized by unpredictable attacks followed by periods of relative remission with no new signs of disease activity.

## **Multiple Sclerosis: Practice Essentials, Background**

The ratio between T1-weighted (T1w) and T2-weighted (T2w) sequences (T1w/T2w-ratio) has been proposed to enhance myelin sensitivity and specificity.<sup>1</sup> However, studies assessing its histopathological substrates in multiple sclerosis (MS) found contradictory results. One study reported lower T1w/T2w-ratio in demyelinated versus normal-appearing cortex, but neurite density was not investigated.<sup>2</sup>
